Soft Tissue Treatment in the Aesthetic Region

23.02.2022
Online
seminar

Nowadays patients became more demanding about aesthetic results when replacing missing tooth with implant or restoring tooth. To completely fulfil the high level expectations of the patients it is very important to not only care about white aesthetics but also to pay attention about the pink one. Many different reconstructive surgical procedures have been developed to attain better aesthetics results of the pink components.

Prosthetic components should be properly designed imitating natural emergence profile in critical region and applied immediately during the soft tissue manipulation procedures. In this manner, the soft tissue is optimally adapted and supported from the beginning of the healing, which enables stable results, optimal balance between white and pink component and successful final aesthetics results.

Guided Implant Surgery

Oral implantology has become a very safe and predictable procedure. Although implant placement and augmentative procedures are routine procedure nowadays, many pitfalls can adversely affect long term satisfaction of the patient and the surgeon. Today the dentist's challenge is to select the appropriate technique and material for the given task while the options and the medical challenges grow constantly.

The literature and nowadays social media boast high success rates and satisfied patients but reality sometimes offers a different picture. This presentation will focus on digital implant planning procedures and guided implant surgery, including the assessment of the case in order to choose the correct technique and material for the given case and how to overcome the limitations of the digital workflow.

Open Day Special 1 / BEGO Guide

Backstage of a Full Digital Workflow Planning

Living in the overwhelmingly promising era of digital evolution, we are focused on using digital technology to find the answers to our questions, and this is definitely justified to a great degree. However, the field of Computer Guided Surgery and Implant Rehabilitation is one with many “Grey Zones”, with a variety of unanswered questions.

This course invites the modern dentist to a trip in some of these “Grey Zones”, and to a fruitful discussion that has one goal: our development as consciously thinking dentists that are the masters of their computers and not the opposite.

Humancourse with Hands-on

80% of the course are hands-on with 20% lectures about explanations of the techniques. A maximum of two participants will be assigned to each cadaver skull. For the cadavers are fresh and not embalmed a nearly “close to reality” simulation of the surgical procedures can be experienced. The participants will have the opportunity to “update” the entire oral anatomy by riskless

exploration of fresh and not embalmed human cadaver skulls. By performing the implant preparing surgical procedures and implantations the participants will learn feasibility, but also the limits are demonstrated. By focussing on risks and complications of such operations and their management the patients safety should be increased.

The Art Behind Dental Photography

Photography is an essential tool in dentistry, not only in legal terms (documentation of clinical cases), but also, among others, for the unquestionable support in the study, planning of cases, in the communication with other colleagues and the dental lab (even when they are in a long distance). The aim of this Workshop is to provide the participants knowledge in general photography. After the training, they will be able to control, in an easy and practical way, their camera during

the daily working routine. During the workshop, all the necessary equipment and accessories will be presented, the entire protocol of photographic settings and setups will be addressed and the participants will have the chance to perform artistic photography in a Photo Studio with a Model and Make-Up Artist.

Digital Approach

Periimplantary Pink & White Aesthetic

One of the crucial problems regarding anterior implant restorations, in terms of Aesthetics, is to provide periimplantary soft tissue integrity. Pink & White Aesthetic may not be accomplished in some clinical cases, although a complete osseointegration is achieved. Biological width hypothesis is important in this context and has gained support in recent years.

Zirconia or glass-ceramics custom abutments have been widely used, due to their optimal emergence profile and natural-like appearance. Moreover, the ones that are placed at the same day of the implant surgery and are never detached again, can provide both a better Aesthetic appearance and prevent any soft tissue related problems, due to the intact-remained biological width.

Open Day Special 2

Hard and Soft Tissue Management Around Dental Implants – A New Era

Because oral implants become a more important treatment option in the treatment array of the dentist, cases become more challenging. Age of the patients, with more underlying medical problems, as well as the group of young people having congenitally missing teeth and patients having trauma in the anterior aesthetic zone, are both increasing. In addition, the increase in prosperity resulted in much higher aesthetic

demands and with that the complexity of cases. Loss of soft- and hard tissue is a major problem in oral implant therapies. Loss of soft- and hard tissue is a major problem in oral implant therapies. Although autologous bone and soft tissue grafts still are the “gold” standard in oral implant surgery, there is great interest in alternatives to these invasive surgical procedures.

Sinus Elevation: Minimizing Complications, Improving Results

25.05.2022
Online
seminar

The concern of all surgeons is to limit the rate of per- and post-operative complications. The tilted bony flap has remained the gold standard of sinus elevation for several decades. Compliance with the recent recommendations of the French society of ORL, progress in surgical instrumentation, the use of platelet concentrates have made it possible to reduce the complication rate of this surgery.

In recent years, the technique of the repositioned bony window has been validated by several animal and human studies. This has proven to improve the quality of the sinus graft.

Depending on all these parameters, 3 surgical techniques will be proposed, adapted to the degree of surgical experience of the surgeon.

Immediate Implant Placement and Prosthetic Driven Soft Tissue Management

10. – 11.06.2022
Zagreb,
Croatia

One of the main advantages of immediate replacement of the extracted tooth with an implant, in the postextraction socket, is a significant reduction of the overall duration of the therapy, because most procedures can be performed in the same session extraction: implantation, preservation of the hard and soft tissue and fabrication of the provisional restoration.

However, immediate implants present a higher risks of graft loss and poor aesthetic outcome, if is not performed according to the established protocols.

It is very important to immediately apply provisional restoration or socket sealing abutment (SSA) with correct emergence profile to optimally support and stabilize soft tissue and preserve natural shape and gain perfect aesthetic results.

Immediate Provisionalization in the Aesthetic Region

22.06.2022
Online seminar

Implant therapy has become a reliable and predictable treatment alternative for the replacement of missing teeth. Recently though, in pursuit for improved aesthetics, the literature has dedicated a considerable amount of its research on the successful maintenance and regeneration of the surrounding gingiva and bone, which are lost following extraction of teeth.

Implant dentistry, especially in the anterior zone, is a complex treatment option. We have to keep in mind the situation of the bone content versus the soft tissue. Through time we have seen a lot of treatment options. Which of them still have a right of survival? We will talk about the history of soft- and hard tissue management. Where are we now, and what is future going to bring?

Life Quality in Just One Day

Patients with complete dentures and bone resorption in the posterior sector of the mouth often suffer from esthetic/functional discomfort, compromised denture retention and inadequate chewing function. Modern implant-supported restoration can enhance

the personal well-being, self-esteem and life quality of these patients, with the installation of a fixed denture in the same day of the implant surgery.

Digital Smile Design (DSD)

Treatment planning a full mouth rehabilitation is really challenging. Once you start preparing the teeth there is no way back, and the patients are more and more demanding each day. “Digital smile design” by Christian Coachman has radically changed the approach to analyzing the aesthetic parameters of our patients and at the same time enhanced the quality of communication with the team members and the patient

himself. Smile design is the starting point of improving diagnosis, treatment plan, and making a decision. In the digital era, it is an unavoidable tool in restorative dentistry.

The aim of this online seminar is to explain the Digital smile design philosophy, show the process of treatment planning, mock up, provisional restorations and the final outcome.

Partial Extraction Therapy

Partial extraction therapy has revolutionized the world of implantology in the last decade. Why is that so? It is well known that tooth extraction results in huge amount of bone loss. In order to prevent the bone loss, different techniques have been proposed. Why is PET superior to the others? This presentation will highlight the PET philosophy, the biology behind the concept and cover the most recent literature.

During the webinar different clinical approaches will be presented – single implant and multiple sites. Different PET procedures will be covered – socket shield, root submergence, pontic shield and Glocker technique. Also, the attendees will benefit from digital approach in socket shield preparation.

Open Day Special 3

From Periodontal Downs to Aesthetic Heights on Implants – A Theory

The soft tissue appearance is most crucial for the aesthetic appearance of implant born solutions. Implants in clinical practice have to compete against the “gold standard“, the original tooth. In direct comparison implants are encountering a few drawbacks especially considering soft tissue integration. But an optimal soft tissue sealing of the transmucosal part of an implant is indispensable in terms of conserving sufficient bony support and delivering a strong back bone against unaesthetic tissue

recession. Therefore it is advisable to take smart measures for bone and soft tissue management in order to ensure sustainable success. The sustainability of a restorative interface is more and more benchmarking the value of clinical concepts and represents the key for aesthetic results the patients are looking for. The amenities of such a concept are highlighted by presenting aesthetically solved cases some of them on a long term basis.

Immediate Implant

Loading in Full Arch-cases – A 12 Year Experience

Participants will learn all the diagnostic, surgical and prosthetic steps, from A to Z, that will make immediate loading of full arches predictably successful. The focus will be on pre-surgical diagnosis and patient preparation, both restoratively and pharmacologically. Systematic implant placement, anatomically and prosthetically guided, will be covered. The choice of the right abutment at the time of the surgery, plus fast and reliable impression techniques,

will be emphasized. There will also be a section on hard and soft tissue augmentation in very atrophic jaws. The right choice implants for each clinical indication will be discussed. Design and manufacturing guidelines of the provisional and permanent prostheses will be highlighted, as well as the economics aspects of a clinical decision.

Digital Workflow with BEGO Guided Surgery

Nowadays we have many tools to provide safe and predictable treatment for our patients. Promising way of digital workflow seems to be invading our practices. How to start our journey with digital implantology and apply it to our everyday life? The purpose of the presentation is to illustrate the application of digital technology in the planning phases, surgical placement

and prosthetic stages of implant treatment. This online webinar will also focus on guided surgery with BEGO implant system from single implant placement to full-arch cases.

Product Presentation

Dear customers and friends of
BEGO Implant Systems,

You are welcome to visit us at our premises in
Bremen. BEGO Implant Systems is a family-
run company and we would like to invite you
to throw a look at our production facilities
and to meet our teams in person. We would
like to show you that “Made in Germany” is
more than just a quality feature for us. For
us it is offering services that fully meet your
needs and requirements in order to provide

the best possible solution for you.
The open days are a perfect opportunity
to spend the professional life in a family
atmosphere.

Further, we would be very happy to take you
on a sightseeing tour through the historical
City Center of Bremen, so that you can meet
our famous “Town Musicians”.

We are looking forward to welcoming you to
our BEGO Family in Bremen!
